

5 **ABSTRACT**

10 The present invention relates to a polypropylene resin composition, more specifically to a polypropylene resin composition comprising ethylene-propylene block copolymer consisting of propylene polymer and ethylene-propylene copolymer with specific limit viscosity and content, ethylene-propylene copolymer rubber, ethylene α-olefin copolymer, inorganic filler, and polar group-consisting resin. It can be applied for peripheral automotive parts like crash pad without using adhesive because it has superior impact resistance and heat resistance, adhesion to urethane foam and forming contraction ratio comparable to that of ABS/PC resin.
